Inverse problem - Wikipedia
An inverse problem in science is the process of calculating from a set of observations the causal factors that produced them: for example, calculating an image in X-ray computed tomography, source reconstruction in acoustics, or calculating the density of the Earth from measurements of its gravity field. It is called an inverse problem because it starts with the results and then calculates the

Transient convective diffusion to a rotating disk ...
Consequently, the solutions of two problems, (iiA and iiB), for which lim(1→∞) θ = 0 although with two different boundary conditions at some finite ζ, are linearly dependent. (This conclusion can also be shown to be valid when a generalised form of eqn. (2) is considered, namely θ'' + PNι+1θ' - ρθ = 0 where PN(ζ) = ν N_->m for finite N and thus the analysis can be extended to m<OUm< much

Direct inverse language - Wikipedia
The definition of a direct inverse language is a matter under research, but it is widely understood to involve different grammar for transitive predications according to the relative positions of their "subject" and their "object" on a person hierarchy, which, in turn, is some combination of saliency and animacy specific to a given language. The direct construction is the unmarked one. The
