Gene Interactions: Allelic and Non-Allelic | Cell Biology

Non-allelic or inter-allelic interactions also occur where the development of single character is due to two or more genes affecting the expression of each other in various ways.

gene-environment interactions - sciencedirect.com

Gene-Environment Interaction. Gene-environment interactions are situations in which environmental factors affect different individuals differently, depending upon genotype, and in which genetic factors have a differential effect, depending upon attributes of the environment.

What is a Gene Interaction? (with pictures) - wisegeek.com

A gene interaction is the result of inheriting genes that conflict in some way, making it impossible for all of them to express as coded, or of inheriting a set of interrelated genes that interact with each other to express a phenotype.

Extensions to Mendelian Genetics

Gene Interactions Extensions to Mendelian Genetics Just as different alleles of 1 gene can interact in complex ways,

2 different genes can also act together to modify a phenotype: 2 genes 1 phenotype (Additive Gene Action)

Complementation (complementary gene action) Epistasis (recessive and dominant) Redundancy, 3 Multifactorial Inheritance Vast majority of traits are determined

Gene Interaction - an overview | ScienceDirect Topics

J. Hodgkin, in Encyclopedia of Genetics, 2001. The term gene interaction has also been used with reference to direct physical interactions between gene products, most usually protein-protein interactions, though protein-RNA, protein-DNA, RNA-RNA, and RNA-DNA interactions may also be encountered.

Gene-Environment Interaction: Epigenetics and Child

Gene-Environment Interaction Science tells us that the interactions between genes and environment shape human development. Despite the misconception that genes are set in stone, research shows that early experiences can determine how genes are turned on and off and even whether some are expressed at all.

Gene Interactions - North Dakota State University

Remember that epistasis is the interaction between different genes. If one allele or allelic pair masks the expression of an allele at the second gene, that allele or allelic pair is epistatic to the second gene. Therefore, the following table summarizes the four epistatic interactions discussed above.
