Gene regulation by steroid hormones - ScienceDirect  
The HREs and Their Interaction with Receptors DNA sequences responsible for regulation by steroid hormones have been found in many inducible genes by gene transfer techniques (Yamamoto, 1985). In some cases these results have been confirmed by direct binding studies with the partially purified hormone receptors Cell 336 A/B 50-500 C D 70 4 5 N - 1 Modulator A Figure 1. Steroid hormones have been localized on target genes providing the long awaited evidence for the concept of a direct effect of the steroid-receptor complex on gene regulation. Purified steroid receptors have been dissected to identify different functional domains.

Another possibility is that binding of the hormone to the receptor leads indeed to a conformational Gene regulation by steroid hormones 13 change of the receptor molecule, not in terms of a DNA binding region being exposed but rather by exposing a so-called nuclear translocation signal, similar to those described recently for the T-antigens of SV40 and polyoma [23, 24]. Still another pos

The signal transduction mechanism is simpler in the case of molecules acting through nuclear receptors able to recognize the signal and to interact directly with the nuclear genome. To this class belong the steroid hormones that influence the expression of a great variety of genes in many different cells.
